

Introduction to Artificial Intelligence

Course syllabus, Fall 2026

Prof. Gilles Louppe

g.louppe@uliege.be

This course is given by

- Theoretical lectures: Gilles Louppe
- Exercise sessions: Fanny Bodart, Thomas Savary, and student instructors.
- Programming projects: Fanny Bodart, Thomas Savary

Feel free to contact us at info8006@montefiore.ulg.ac.be or on [Discord](#) for help.

Materials

The schedule and slides are available at github.com/glouppe/info8006-introduction-to-ai.

- In HTML and in PDFs.
- Minor updates up to the day before the lesson.

Official course description: [engagements pédagogiques](#).

Videos

- Lectures from Fall 2024 are available on [MyUnicast](#) and on [YouTube](#).
- Videos from Fall 2020 are available on [YouTube](#). They are not up-to-date with the current course, but they may still be useful.

Textbook

Some of the course content is based on the following textbook:

Stuart Russell, Peter Norvig. "Artificial Intelligence: A Modern Approach", Fourth Edition, Global Edition.

This textbook is **recommended**. It covers both the theory and the exercises.

CS188

- Lectures, exercises, and various other materials are partially adapted from [CS188 Introduction to Artificial Intelligence](#), from UC Berkeley.
- Cartoons that you will see in those slides were all originally made for CS188.

Exercise sessions

- Every week, after the lecture.
- You solve exercises alone or in small groups, and ask us when you are stuck.
- Solutions are provided for all exercises.

The written exam asks problems of the same kind, and you sit it alone, without documents. Reading a solution does not teach you to produce one.

Programming projects

Implement an intelligent agent for playing **Pacman**.

Evaluation

- Written exam (70%)
- Programming projects (30%)
 - Project 0: 0% (tutorial of September 24)
 - Project 1: 15%
 - Project 2: 15%
- Programming projects are **mandatory** for sitting the exam.

You must obtain at least 8/20 on the written exam. If you do, the final grade is the weighted average of the exam (70%) and the projects (30%). Otherwise, the final grade is the exam grade.

Evaluation of the projects

- The correctness of your implementation is **automatically** checked on Gradescope.
- Projects also include an **oral defense**: you answer questions on your own code, justify your design decisions, and may be asked to modify or extend your implementation.

Use of AI tools

AI assistants are **allowed** in the projects, without restriction.

The rule is simple: everything you submit, you must be able to explain. At the defense you answer for any line, justify your design decisions, and modify your code on request. You may submit code written with the help of an AI assistant, but you may not submit code you cannot answer for. A solution you cannot explain will be strongly penalized.

An AI assistant is **not someone else**: what it writes is yours to own and to answer for. **Other people's work** (a classmate's code, a public repository, a past submission) is a different matter, and the honor code governs it.

Honor code

You may consult papers, books, online references, or publicly available implementations for ideas that you may want to adapt and incorporate into your projects, so long as you clearly cite your sources in your code and your writeup. *However, under no circumstances, may you base your project on someone else's implementation.*

Plagiarism is checked and sanctioned by a grade of 0. Cases of plagiarism will all be reported to the Faculty office.

Let's start!
